for the design of control programs in extreme cases as discussed below by Fine et al. This volume and elsewhere it can happen that immunization programs although they protect vaccinated individuals actually increase the overall incidence of a particular disease. The possibility that many nonhuman animal populations may be regulated by parasitic infections is another topic where it may be argued that conventional disciplinary boundaries have retarded investigation while much ecological research has been devoted to exploring the extent to which competition or predator-prey interactions may regulate natural populations or set their patterns of geographical distribution. Few substantial studies have considered the possibility that infectious diseases may serve as regulatory agents. 18 On the other hand, the many careful epidemiological studies of the transmission and maintenance of parasitic infections in human and other animal populations usually assume the host population density to be set by other considerations and not dynamically engaged with the disease. See for example 12. With all these considerations in mind, the Dahlem Workshop from which this book derives aimed to weave strands together, testing theoretical analysis against empirical facts and patterns and identifying outstanding problems in pursuit of a better understanding of the overall population biology of parasitic infections. For the purpose of the workshop, the term parasite was defined widely to include viruses, bacteria, protozoans, fungi, and helminths.
